FOR IMMEDIATE RELEASE

Polarion Software Releases Multiple Plugins for Subversion

Stuttgart, Germany, September 9, 2005 — Polarion Software, creators of fully integrated application lifecycle management solutions and services, has made available a series of plugins for importing data from various commercial configuration management systems into Subversion.

Subversion users can now import data from the following commercial products to Subversion:

- CVS (the official predecessor of Subversion)
- Serena/PVCS Version Manager
- IBM Rational ClearCase
- Telelogic CMSynergy

These plugins support the most widely used current commercial products. For users of the open source Subversion, the plugins represent an additional protection for their investment, because quick, more trouble-free migration now becomes possible.

"Nowadays hardly any projects start with the proverbial 'blank sheet', " said Frank Schröder, CEO of Polarion."It was very important for us to provide Subversion users with a way to import existing data into Subversion as quickly and smoothly as possible."

In addition to the plugins, Polarion Software offers professional services around Subversion to ensure optimal return in value during and after Subversion implementations.

Subversion is used as a centralized repository in Polarion for Subversion, the commercial Application Lifecycle Management product from Polarion Software, underlining Polarion's depth of know-how with Subversion.
